

Initial Project Proposal

Name: N. Bavanika (JF/ICT/24/19)

1. Project Title

ReUseHub – Reuse and Redistribution System

2. Project Description

ReUseHub is a web-based system designed for university students and staff to share and reuse unwanted but usable items. Users can post items they no longer need, and other users can browse the available items and send requests for the ones they are interested in. The system aims to encourage the reuse of usable items and reduce unnecessary waste within the university community.

3. Problem Statement

Students and staff often have usable items that they no longer need, such as books, stationery, electronics, or furniture. These items are frequently kept unused or thrown away, even though other students or staff members within the university may need them. There is currently no simple platform within the university to connect people who have unwanted items with people who are looking for them, resulting in unnecessary waste and missed opportunities for reuse.

4. Project Objectives

- * To develop a simple system for reusing unwanted items within the university.
- * To allow users to post items they no longer need.
- * To help users find useful second-hand items within the university community.
- * To reduce unnecessary disposal of usable items.
- * To provide a simple way for users to request available items.

- * To encourage sustainable practices by reducing waste through item reuse.

5. Target Users

- * University Students
- * University Staff

6. Main System Features

- * User registration and login
- * Add and manage items
- * View and search available items
- * View item details
- * Send item requests
- * Accept or reject requests
- * Update item status (Available, Requested, and Given Away)
- * View posted items and received/sent requests

7. Proposed Technology Stack

Frontend: HTML, CSS, JavaScript

Backend: PHP

Database: MySQL

8. Expected Outcome

The expected outcome is a simple and user-friendly web-based system that helps university students and staff reuse unwanted but usable items. The system will connect users who have unwanted items with those who need them, encouraging reuse instead of unnecessary disposal and contributing to a more sustainable university community.
